I CLAIM:

1. A toothbrush comprising:

an inner handle part having an outer end;

an outer handle part having an outer end remote from
the inner handle part and an inner end juxtaposed with the inner-

5 part outer end;

bristles on the outer-part outer end; and

a releasable joint between the inner-part outer end and

the inner-part inner end joining the handle parts together and so

constructed as to open and release when a lateral force is

applied to the outer-part outer end that exceeds a predetermined

safe brushing force.

- 2. The toothbrush defined in claim 1 wherein the joint is a ball-and-socket snap joint.
- 3. The toothbrush defined in claim 1, further comprising
- a tether between the handle parts, whereby the parts
- remain connected together by the tether even when the joint
- 5 opens.

- 4. The toothbrush defined in claim 3 wherein the tether is a flexible web extending between the outer-part inner end and the inner-part outer end.
- 5. The toothbrush defined in claim 4 wherein the tether is molded unitarily with the inner part and outer part.
